

Gastropoda e Scaphopoda del Porto di Livorno

Manrico Coppini, Fabrizio Cuneo, Alessandro Margelli & Enzo Campani

Riassunto

Vengono riportati alcuni risultati di dragaggi effettuati sistematicamente dagli autori all'interno dei moli delimitanti il porto di Livorno, Tirreno Settentrionale, Italia. Sono segnalate ed illustrate alcune specie di molluschi Gasteropodi e Scafopodi la cui presenza e/o iconografia è stata ritenuta interessante.

Abstract

We report a first part (Gastropoda and Scaphopoda) of the results of our dredgings on the bottoms of the Livorno harbour, North Tyrrhenian Sea, Italy. The dredgings had the goal to compare the molluscs fauna found in these potentially impacted environments with the available faunistic lists for the littoral communities surrounding the Livorno harbour area. We found on the whole thirteen species: 12 Gastropoda and 1 Scaphopoda. Eight of these species are reported for the first time for the Livorno sea. Each species has been illustrated and its occurrence ecology commented. To our knowledge *Philine denticulata* is herein photographed for the first time

Key words

Gastropoda, Scaphopoda, Mare Toscano, Philine, Dragaggi.
